# **Acronyms**

**BI** Business Intelligence

**CDC** Change Data Capture

CRISP-DM Cross Industry Standard Process for Data Mining

**DFM** Dimensional Fact Model

**DM** Data Mart

**DSS** Decision Support System

**DWH** Data Warehouse

**EIS** Executive Information System

**ERP** Enterprise Resource Planning

ETL Extraction, Transformation, Loading

MIS Management Information System

**OLAP** Online Analysical Processing

**OLTP** Online Transaction Processing

## 1 Introduction

## 1.1 Data

Data Collection of raw values.

Data

**Information** Organized data (e.g. relationships, context, ...).

Information

**Knowledge** Understanding information.

Knowledge

#### 1.1.1 Data sources

**Transaction** Business event that generates or modifies data in an information system (e.g. database).

Transaction

**Signal** Measure produced by a sensor.

Signal

## **External subjects**

## 1.1.2 Software

**Online Transaction Processing (OLTP)** Class of programs to support transaction oriented applications and data storage. Suitable for real-time applications.

Online Transaction Processing

**Enterprise Resource Planning (ERP)** Integrated system to manage all the processes of a business. Uses a shared database for all applications. Suitable for real-time applications.

Enterprise Resource Planning

## 1.1.3 Insight

Decision can be classified as:

**Structured** Established and well understood situations. What is needed is known.

Structured decision

**Unstructured** Unplanned and unclear situations. What is needed for the decision is unknown.

Unstructured decision

Different levels of insight can be extracted by:

**Management Information System (MIS)** Standardized reporting system built on existing OLTP. Used for structured decisions.

Management Information System

**Decision Support System (DSS)** Analytical system to provide support for unstructured decisions.

Decision Support System

**Executive Information System (EIS)** Formulate high level decisions that impact the organization.

Executive Information System

**Online Analysical Processing (OLAP)** Grouped analysis of multidimensional data. Involves large amount of data.

Online Analysical Processing **Business Intelligence (BI)** Applications, infrastructure, tools and best practices to analyze information.

Business Intelligence

**Big data** Large and/or complex and/or fast changing collection of data that traditional DBMSs are unable to process.

Big data

**Structured** e.g. relational tables.

Unstructured e.g. videos.

Semi-structured e.g. JSON.

**Anaylitics** Structured decision driven by data.

Anaylitics

Data mining

**Data mining** Discovery process for unstructured decisions.

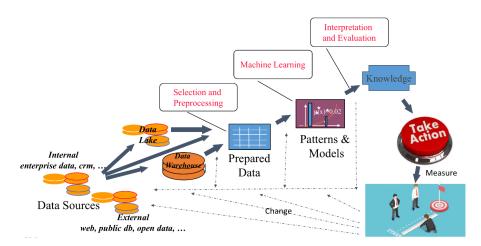

Figure 1.1: Data mining process

**Machine learning** Learning models and algorithms that allow to extract patterns from Machine learning data.

## 2 Data warehouse

**Business Intelligence** Transform raw data into information. Deliver the right information to the right people at the right time through the right channel.

Business Intelligence

**Data Warehouse (DWH)** Optimized repository that stores information for decision making processes. DWHs are a specific type of DSS.

Data Warehouse

#### Features:

- Subject-oriented: focused on enterprise specific concepts.
- Integrates data from different sources and provides an unified view.
- Non-volatile storage with change tracking.

**Data Mart (DM)** Subset of the primary DWH with information relevant to a specific Data Mart business area.

## 2.1 Online Analysical Processing (OLAP)

**OLAP analyses** Able to interactively navigate the information in a data warehouse. Allows to visualize different levels of aggregation.

Online Analysical Processing (OLAP)

**OLAP session** Navigation path created by the operations that a user applied.

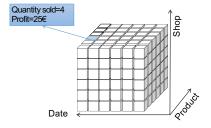

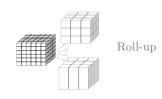

Figure 2.1: OLAP data cube

## 2.1.1 Operators

 $\label{eq:Roll-up} \textbf{Roll-up} \begin{tabular}{l} \textbf{Increases the level of aggregation (i.e. \ \tt{GROUP} \ BY in \ SQL)}. \ Some \\ \textbf{details are collapsed together}. \end{tabular}$ 

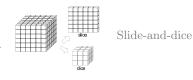

**Drill-down** Reduces the level of aggregation. Some details are reintroduced.

The slice operator reduces the number of dimensions (i.e. drops columns).

Slide-and-dice

The dice operator reduces the number of data being analyzed (i.e. LIMIT in SQL).

Changes the layout of the data, to analyze it from a different viewpoint.

**Drill-across** Links concepts from different data sources (i.e. JOIN in SQL).

**Drill-through** Switches from multidimensional aggregated data to operational data (e.g. Drill-through a spreadsheet).

## 2.2 Extraction, Transformation, Loading (ETL)

The ETL process extracts, integrates and cleans operational data that will be loaded into a data warehouse.

Extraction, Transformation, Loading (ETL)

#### 2.2.1 Extraction

Extracted operational data can be:

**Structured** with a predefined data model (e.g. relational DB, CSV)

Strucured data

**Untructured** without a predefined data model (e.g. social media content)

Unstrucured data

Extraction can be of two types:

**Static** The entirety of the operational data are extracted to populate the data warehouse for the first time.

Static extraction

**Incremental** Only changes applied since the last extraction are considered. Can be based on a timestamp or a trigger.

Incremental extraction

## 2.2.2 Cleaning

Operational data may contain:

**Duplicate data** 

Missing data

Improper use of fields (e.g. saving the phone number in the notes field)

Wrong values (e.g. 30th of February)

**Inconsistency** (e.g. use of different abbreviations)

### **Typos**

Methods to clean and increase the quality of the data are:

**Dictionary-based techniques** Lookup tables to substitute abbreviations, synonyms or typos. Applicable if the domain is known and limited.

Dictionary-based cleaning

**Approximate merging** Merging data that do not have a common key.

Approximate merging

**Approximate join** Use non-key attributes to join two tables (e.g. using the name and surname instead of an unique identifier).

**Similarity approach** Use similarity functions (e.g. edit distance) to merge multiple instances of the same information (e.g. typo in customer surname).

Ad-hoc algorithms

Ad-hoc algorithms

### 2.2.3 Transformation

Data are transformed to respect the format of the data warehouse:

**Conversion** Modifications of types and formats (e.g. date format)

Conversion

**Enrichment** Creating new information by using existing attributes (e.g. compute profit from receipts and expenses)

Enrichment

**Separation and concatenation** Denormalization of the data: introduces redundances (i.e. breaks normal form<sup>1</sup>) to speed up operations.

Separation and concatenation

## 2.2.4 Loading

Adding data into a data warehouse:

**Refresh** The entire DWH is rewritten.

Refresh loading

**Update** Only the changes are added to the DWH. Old data are not modified.

Update loading

## 2.3 Data warehouse architectures

The architecture of a data warehouse should meet the following requirements:

**Separation** Separate the analytical and transactional workflows.

**Scalability** Hardware and software should be easily upgradable.

**Extensibility** Capability to host new applications and technologies without the need to redesign the system.

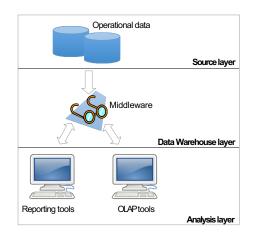

**Security** Access control.

Administrability Easily manageable.

<sup>1</sup>https://en.wikipedia.org/wiki/Database\_normalization

## 2.3.1 Single-layer architecture

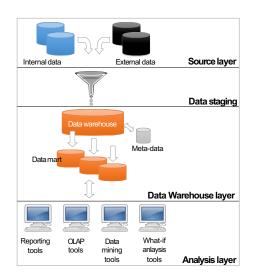

- Minimizes the amount of data stored (i.e. no redundances).
- The source layer is the only physical layer (i.e. no separation).
- A middleware provides the DWH features.

Single-layer architecture

## 2.3.2 Two-layer architecture

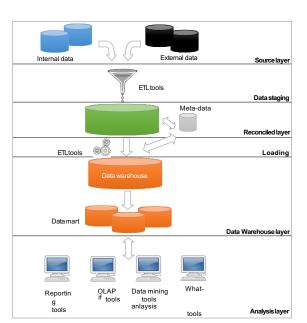

- Source data (source layer) are physically separated from the DWH (data warehouse layer).
- A staging layer applies ETL procedures before populating the DWH.
- The DWH is a centralized repository from which data marts can be created. Metadata repositories store information on sources, staging and data marts schematics.

Two-layer architecture

## 2.3.3 Three-layer architecture

• A reconciled layer enhances the cleaned data coming from the staging step by adding enterprise-level details (i.e. adds more redundancy before populating the DWH).

Three-layer architecture

## 2.4 Conceptual modeling

**Dimensional Fact Model (DFM)** Conceptual model to support the design of data marts. The main concepts are:

Dimensional Fact Model (DFM)

Fact Concept relevant to decision-making processes (e.g. sales).

**Measure** Numerical property to describe a fact (e.g. profit).

**Dimension** Property of a fact with a finite domain (e.g. date).

**Dimensional attribute** Property of a dimension (e.g. month).

**Hierarchy** A tree where the root is a dimension and nodes are dimensional attributes (e.g. date  $\rightarrow$  month).

**Primary event** Occurrence of a fact. It is described by a tuple with a value for each dimension and each measure.

**Secondary event** Aggregation of primary events. Measures of primary events are aggregated if they have the same (preselected) dimensional attributes.

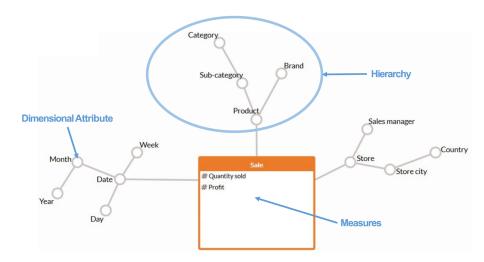

Figure 2.2: Example of DFM

Primary events								
Date	Store	Product		Qty sold		Profit		
01/03/15	Central store	e Milk		20		60		0
01/03/15	01/03/15 Central store				25		5	0
02/03/15	02/03/15 Central store				40		7	0
10/03/15 Central stor		e Wine			15		15	0
Second	dary event		SL	JM ,	,	S	UM	
Month	Store	Category		Qty	sold		Profi	it
March 2015					10	0		330

Figure 2.3: Example of primary and secondary events

## 2.4.1 Aggregation operators

Measures can be classified as:

Flow measures Flow measures Evaluated cumulatively with respect to a time interval (e.g. quantity sold).

Level measures **Level measures** Evaluated at a particular time (e.g. number of products in inventory).

Unit measures **Unit measures** Evaluated at a particular time but expressed in relative terms (e.g. unit price).

Aggregation operators can be classified as:

**Distributive** Able to calculate aggregates from partial aggregates (e.g. SUM, MIN, MAX).

**Algebraic** Requires a finite number of support measures to compute the result (e.g. AVG).

**Holistic** Requires an infinite number of support measures to compute the result (e.g. Holistic operators RANK).

Distributive operators

Algebraic operators

Additive measure **Additivity** A measure is additive along a dimension if an aggregation operator can be

applied.		
	Temporal hierarchies	Non-temporal hierarchies
Flow measures	SUM, AVG, MIN, MAX	SUM, AVG, MIN, MAX

SUM, AVG, MIN, MAX

AVG, MIN, MAX

Table 2.1: Allowed operators for each measure type

AVG, MIN, MAX

AVG, MIN, MAX

## 2.4.2 Logical design

Level measures

Unit measures

Defining the data structures (e.g. tables and relationships) according to a conceptual Logical design model. There are mainly two strategies:

Star schema Star schema A fact table that contains all the measures and linked to dimensional tables.

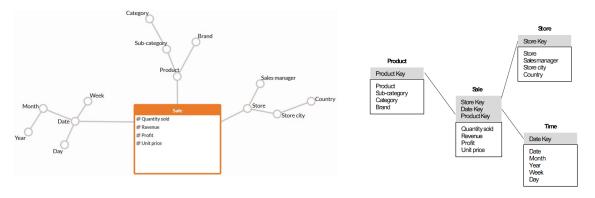

Figure 2.4: Example of star schema

Snowflake schema **Snowflake schema** A star schema variant with partially normalized dimension tables.

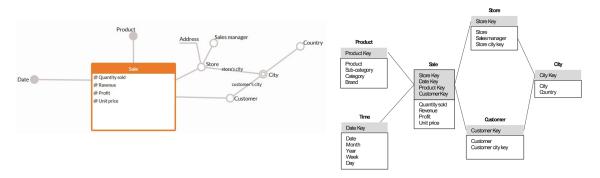

Figure 2.5: Example of snowflake schema

# Data lake

Dark data Acquired and stored data that are never used for decision-making processes.

Dark data

Data lake Repository to store raw (unstructured) data. It has the following features:

Data lake

- Does not enforce a schema on write.
- Allows flexible access and applies schemas on read.
- Single source of truth.
- Low cost and scalable.

Storage Stored data can be classified as:

Hot A low volume of highly requested data that require low latency. More ex-Hot storage pensive HW/SW.

Cold storage Cold A large amount of data that does not have latency requirements. Less expensive.

Data warehouse	Data hub	Data lake
<del></del>		<b>─</b>
Hot		Cold

Figure 3.1: Data storage technologies

## 3.1 Traditional vs insight-driven data systems

	Traditional (data warehouse)	Insight-driven (data lake)		
Sources	Structured data	Structured, semi-structured and un-		
		structured data		
Storage Limited ingestion and storage capa- Virtually unlimited in		Virtually unlimited ingestion and		
	bility	storage capability		
Schema	Schema designed upfront	Schema not fixed		
Transformations	ETL upfront	Transformations on query		
Analytics	SQL, BI tools, full-text search	Traditional methods, self-service BI,		
		big data, machine learning,		
Price	High storage cost	Low storage cost		
Performance	Fast queries	Scalability/speed/cost tradeoffs		
Quality	High data quality	Depends on the use case		

## 3.2 Data architecture evolution

**Traditional data warehouse** (i.e. in-house data warehouse)

Traditional data warehouse

- Structured data with predefined schemas.
- High setup and maintenance cost. Not scalable.

- Relational high-quality data.
- Slow data ingestion.

#### Modern cloud data warehouse

- Structured and semi-structured data.
- Low setup and maintenance cost. Scalable and easier disaster recovery.
- Relational high-quality data and mixed data.
- Fast data ingestion if supported.

On-premise big data (i.e. in-house data lake)

- Any type of data with schemas on read.
- High setup and maintenance cost.
- Fast data ingestion.

Cloud data lake

Cloud data lake

Modern cloud data

On-premise big data

warehouse

- Any type of data with schemas on read.
- Low setup and maintenance cost. Scalable and easier disaster recovery.
- Fast data ingestion.

## 3.3 Components

## 3.3.1 Data ingestion

Data ingestion

Workload migration Inserting all the data from an existing source.

**Incremental ingestion** Inserting changes since the last ingestion.

**Streaming ingestion** Continuously inserting data.

**Change Data Capture (CDC)** Mechanism to detect changes and insert the new data into the data lake (possibly in real-time).

Change Data
Capture (CDC)

## 3.3.2 Storage

Raw Immutable data useful for disaster recovery.

Raw storage

**Optimized** Optimized raw data for faster query.

Optimized storage

**Analytics** Ready to use data.

Analytics storage

#### Columnar storage

- Homogenous data are stores contiguously.
- Speeds up methods that process entire columns (i.e. all the values of a feature).
- Insertion becomes slower.

**Data catalog** Methods to add descriptive metadata to a data lake. This is useful to prevent an unorganized data lake (data swamp).

## 3.3.3 Processing and analytics

Processing and analytics

**Interactive analytics** Interactive queries to large volumes of data. The results are stored back in the data lake.

Big data analytics Data aggregations and transformations.

Real-time analytics Streaming analysis.

## 3.4 Architectures

### 3.4.1 Lambda lake

Lambda lake

Batch layer Receives and stores the data. Prepares the batch views for the serving layer.

**Serving layer** Indexes batch views for faster queries.

**Speed layer** Receives the data and prepares real-time views. The views are also stored in the serving layer.

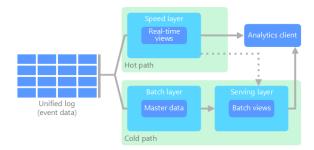

Figure 3.2: Lambda lake architecture

## 3.4.2 Kappa lake

The data are stored in a long-term store. Computations only happen in the speed layer Kappa lake (avoids lambda lake redundancy between batch layer and speed layer).

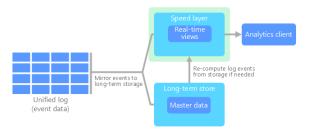

Figure 3.3: Kappa lake architecture

## 3.4.3 Delta lake

Framework that adds features on top of an existing data lake.

Delta lake

- ullet ACID transactions
- Scalable metadata handling
- Data versioning
- Unified batch and streaming
- Schema enforcement

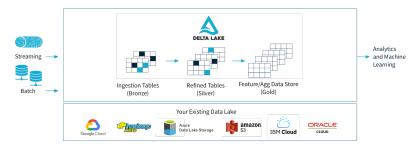

Figure 3.4: Delta lake architecture

## 3.5 Metadata

Metadata are used to organize a data lake. Useful metadata are:

Metadata

**Source** Origin of the data.

**Schema** Structure of the data.

**Format** File format or encoding.

Quality metrics (e.g. percentage of missing values).

**Lifecycle** Retention policies and archiving rules.

Ownership

Lineage History of applied transformations or dependencies.

Access control

Classification Sensitivity level of the data.

**Usage information** Record of who accessed the data and how it is used.

# 4 CRISP-DM

Cross Industry Standard Process for Data Mining Standardized process for data mining.

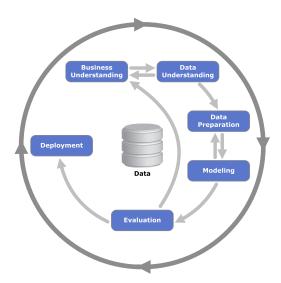

Figure 4.1: CRISP-DM workflow

## 4.1 Business understanding

- Determine the objective and the success criteria.
- Feasibility study.
- Produce a plan.

## 4.2 Data understanding

- Determine the available (raw) data.
- Determine the cost of the data.
- Collect, describe, explore and verify data.

## 4.3 Data preparation

- Data cleaning.
- Data transformations.

Business understanding

Data understanding

Data preparation

# 4.4 Modelling

• Select modelling technique.

Modelling

• Build/train the model.

## 4.5 Evaluation

• Evaluate results.

• Review process.

## 4.6 Deployment

• Plan deployment.

• Plan monitoring and maintenance.

• Final report and review.

# 5 Machine learning

Machine learning Application of methods and algorithms to extract patterns from data. Machine learning

## 5.1 Tasks

**Classification** Estimation of a finite number of classes.

**Regression** Estimation of a numeric value.

**Similarity matching** Identify similar individuals.

Clustering Grouping individuals based on their similarities.

**Co-occurrence groupping** Identify associations between entities based on the transactions in which they appear together.

**Profiling** Behavior description.

**Link analysis** Analysis of connections (e.g. in a graph).

**Data reduction** Reduce the dimensionality of data with minimal information loss.

**Casual modeling** Understand the connections between events and actions.

## 5.2 Categories

**Supervised learning** Problem where the target(s) is defined.

Supervised learning

**Unsupervised learning** Problem where no specific target is known.

Unsupervised learning Reinforcement

**Reinforcement learning** Learn a policy to generate a sequence of actions.

Reinforcem learning

#### 5.3 Data

**Dataset** Set of N individuals, each described by D features.

Dataset

#### 5.3.1 Data types

**Categorical** Values with a discrete domain.

**Nominal** The values are a set of non-ordered labels.

Categorical nominal

data

Operators.  $=, \neq$ 

Example. Name, surname, zip code.

**Ordinal** The values are a set of totally ordered labels.

Categorical ordinal

data

Operators.  $=, \neq, <, >, \leq, \geq$ 

**Example.** Non-numerical quality evaluations (excellent, good, fair, poor, bad).

**Numerical** Values with a continuous domain.

**Interval** Numerical values without an univocal definition of 0 (i.e. 0 is not used as reference). It is not reasonable to compare the magnitude of this type of data.

Numerical interval data

**Operators.**  $=, \neq, <, >, \leq, \geq, +, -$ 

Example. Celsius and Fahrenheit temperature scales, CGPA, time.

For instance, there is a 6.25% increase from  $16^{\circ}$ C to  $17^{\circ}$ C, but converted in Fahrenheit, the increase is of 2.96% (from  $60.8^{\circ}$ F to  $62.6^{\circ}$ F).

Ratio Values with an absolute 0 point.

Numerical ratio data

**Operators.**  $=, \neq, <, >, \leq, \geq, +, -$ 

Example. Kelvin temperature scale, age, income, length.

For instance, there is a 10% increase from 100\$ to 110\$. Converted in euro  $(1 \in = 1.06\$)$ , the increase is still of 10% (from  $94.34 \in to 103.77 \in t$ 

### 5.3.2 Transformations

Data t	ype	Transformation		
Categorical	Nominal	One-to-one transformations		
Categorical	Ordinal	Order preserving transformations (i.e.		
Ordinal   monotonic fund		monotonic functions)		
Numerical	Interval	Linear transformations		
Numericai	Ratio	Any mathematical function, standardization,		
	Ttatio	variation in percentage		

#### 5.3.3 Dataset format

**Relational table** The attributes of each record are the same.

Relational table

**Data matrix** Matrix with N rows (entries) and D columns (attributes).

Data matrix

**Sparse matrix** Data matrix with lots of zeros.

Sparse matrix

**Example** (Bag-of-words). Each row represents a document, each column represents a term. The i, j-th cell contains the frequency of the j-th term in the i-th document.

**Transactional data** Each record contains a set of objects (not necessarily a relational table).

Transactional data

**Graph data** Set of nodes and edges.

Graph data

**Ordered data** e.g. temporal data.

Ordered data

## 5.3.4 Data quality

**Noise** Alteration of the original values.

Noise

**Outliers** Data that considerably differ from the majority of the dataset. May be caused by noise or rare events.

Outliers

Box plots can be used to visually detect outliers.

Missing values Data that have not been collected. Sometimes they are not easily recognizable (e.g. when special values are used, instead of null, to mark missing data).

Missing values

Can be handled in different ways:

- Ignore the records with missing values.
- Estimate or default missing values.
- $\bullet$  Ignore the fact that some values are missing (not always applicable).
- Insert all the possible values and weight them by their probability.

**Duplicated data** Data that may be merged.

Duplicated data
